Hackazon Setup!

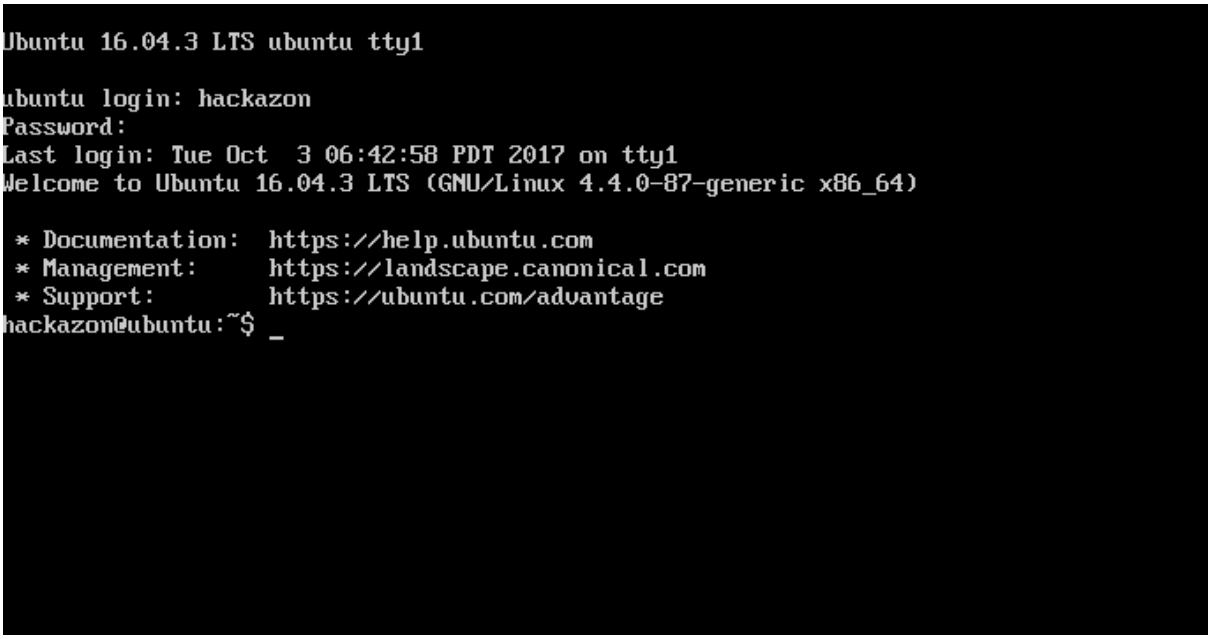

For those who may be having a hard time setting up hackazon.

I downloaded the .OVA file from this site. This is a safe download. I got it off the hackazon wiki linked on github. You may need to request access. I got access within 15ish minutes.
https://drive.google.com/open?id=0B7KzT3FP4YOoRkp6empQQi1WTXM

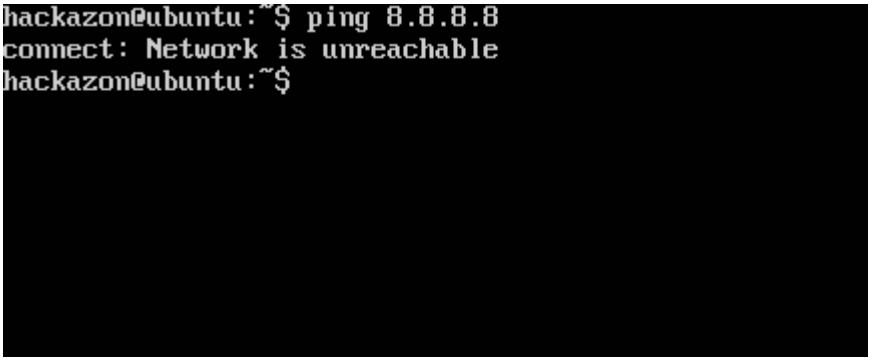

Once the file was downloaded I opened it. I have my Virtualbox set up to run .OVA files. In Virtualbox I used the default settings that the system had selected.

The username and password are hackazon (Note: the password doesn't show your input, it will look blank)

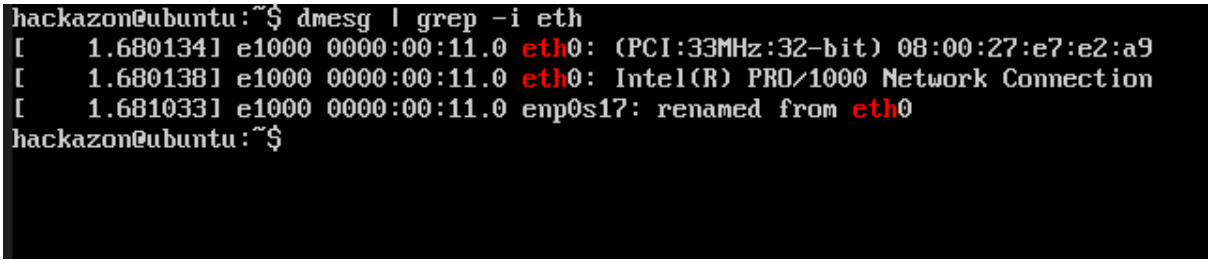

Once logged in it should look like this.

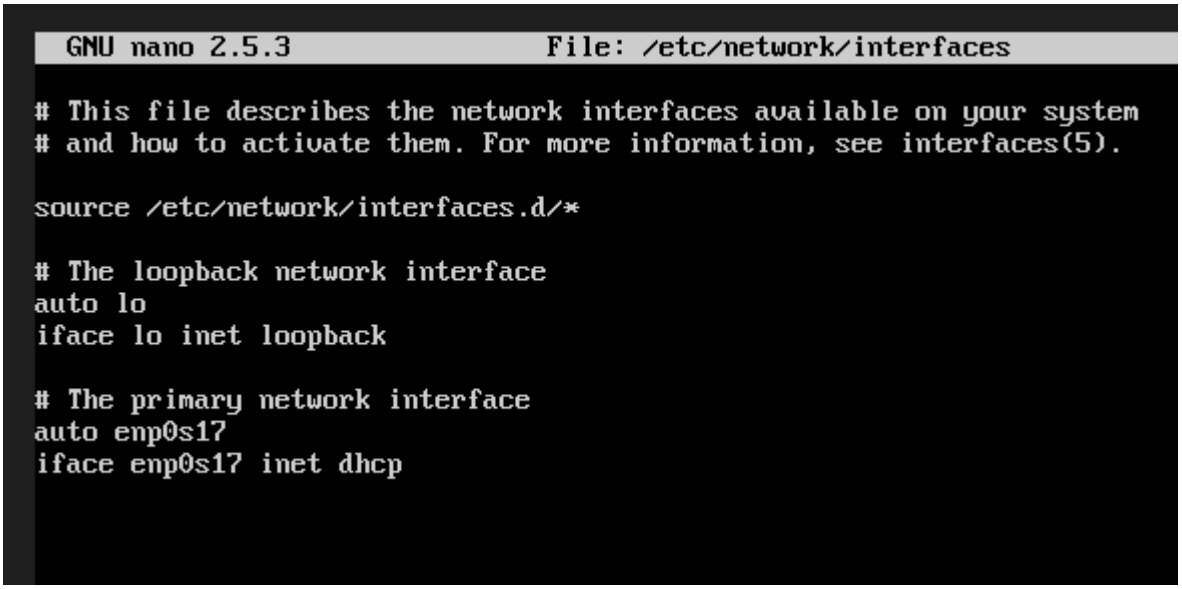

This VM requires some set up. First **ping 8.8.8.8** (google). If it says the network is unreachable we have some work to do.

Next run the command **dmesg | grep -i eth**

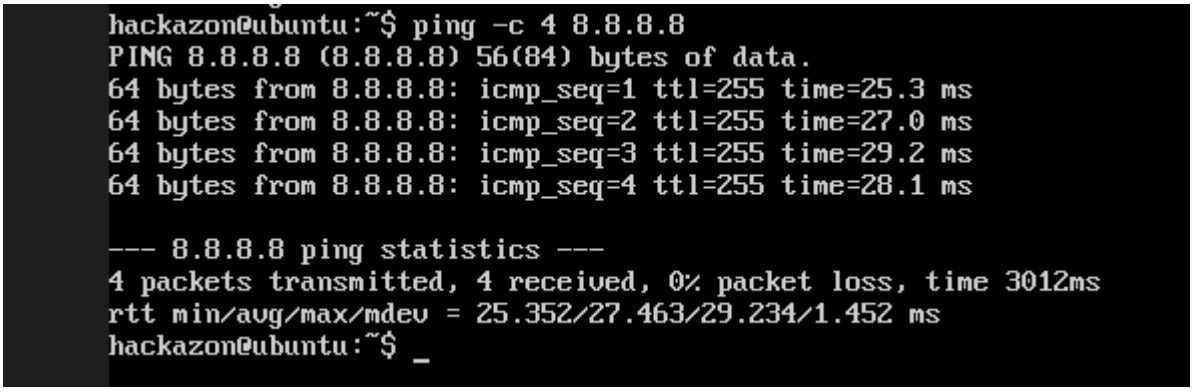

We care about that last line. Specifically the part after the numbers. We can see eth0 was renamed to **enp0s17**. (Your system may have a different name, I tested this twice on two different machines and they were both the same.)

Next we use **sudo nano /etc/network/interfaces**.

Under the section for the primary network interface we change the name that was there to the name we found previously **enp0s17** (or whatever you had). When you are done simply **control X, Y, enter.** That will save and exit the file. We don't want to change the file name

Once you save the file changes, restart the VM. Once you log back in use the command **ping -c 4 8.8.8.8** this will send 4 pings to google.

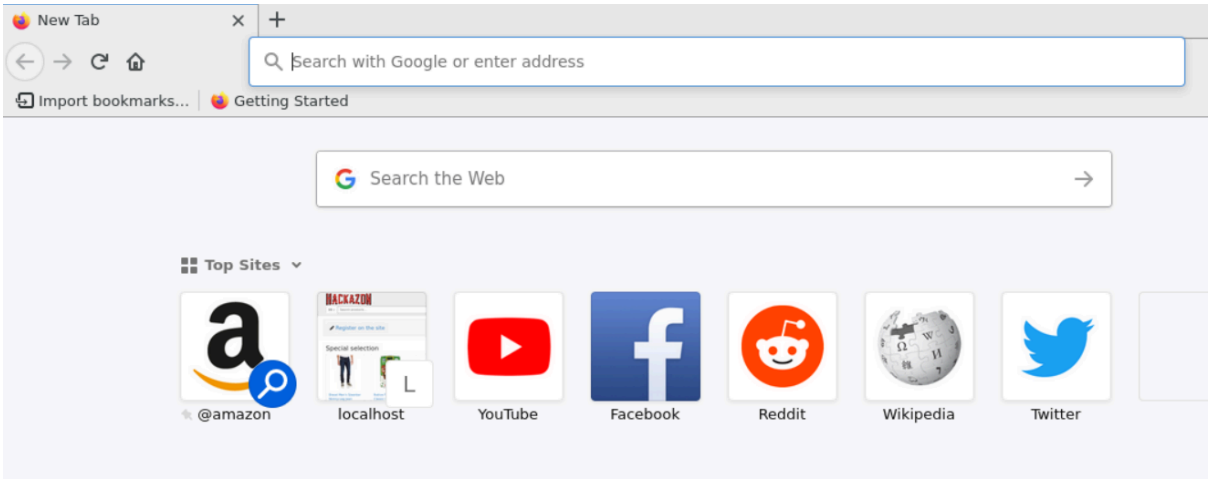

All four should have made it. Now we are connected to the internet.

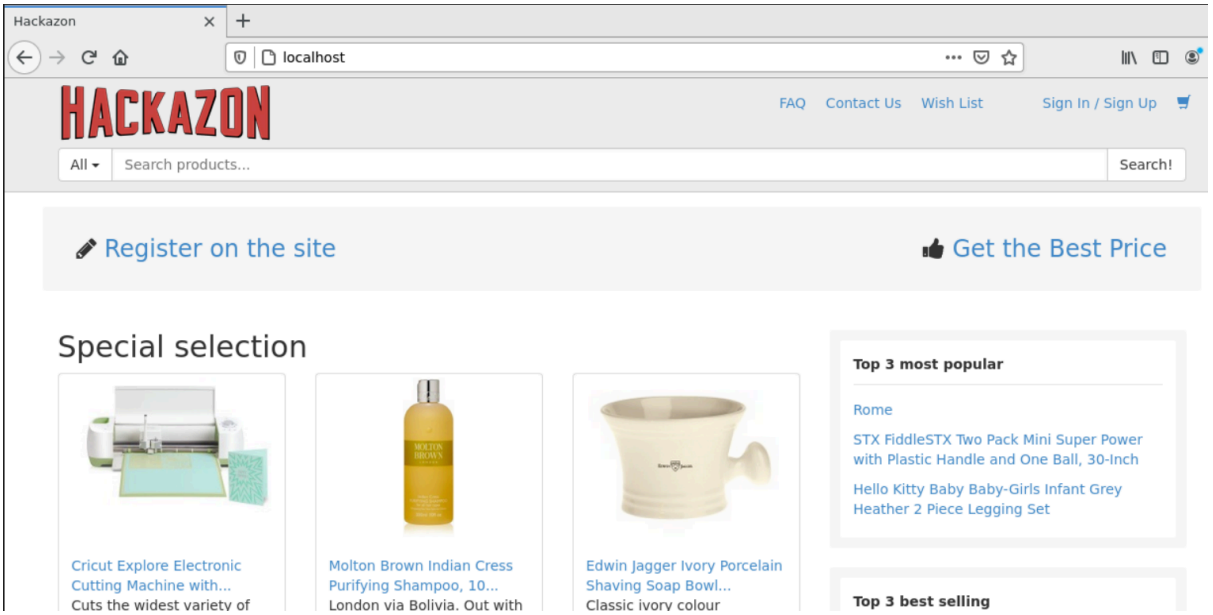

```

Next we download firefox using **sudo apt install firefox**. Let it install. Next we need to install a way to display firefox **sudo apt install xorg xinit firefox -y**. Once that installs run **startx firefox** to open firefox.

Once in firefox go to **http://localhost/**

There you go, Hackazon! If you close the VM you will just need to reopen firefox and go back to the site. I hope this helps.

If you want to increase the size of the VirtualBox window you can go to the top of the VM where it says View, select Virtual Screen 1, and resize it.
